

Congratulations!

You have successfully installed http://profiles.tiki.org/r_test, with a new menu on the side column to ease the navigation tasks and a bunch of potentially useful links.

Environment ready?

1.1. Is PluginR installed?

If you see a series of numbers from 1 to 10 below, this means that you have your <https://doc.tiki.org/PluginR> already installed successfully in your Tiki site.

[1] 1 2 3 4 5 6 7 8 9 10

Otherwise, you need to install PluginR as admin by means of:

- **tiki-mods.php** (tiki-mods.php?action=install&package=wikiplugins-r) through the Tiki interface to install mods (see it in section 'Wiki plugins' at the bottom of the list).

Or alternatively, install manually by

- downloading PluginR from <http://mods.tiki.org>, decompressing it locally, and uploading the folders to their equivalent folders in the server side.

Help

- Accepted parameters in the version of PluginR installed in this system
